

Time to leave Fiebig staging in the dust?

Estimated Dates of Detectable Infection (EDDIs) as a new and improved method for HIV infection dating

Disclosures

Drs. Facente, Grebe, and Busch have received research support from Sedia Biosciences Corporation. Drs. Facente and Grebe have received consulting support and research funding from Gilead Sciences, and through the CDC-funded TRACE program, as a subcontract from the University of California, San Francisco.

These companies and programs had no input into nor influence over the current work.

1

Why not stick with Fiebig staging?

Why is Fiebig staging outdated?

- Since this method was published in 2003, HIV testing technology has evolved substantially.

- Fiebig stages were defined using estimated length of time it takes for each of 5 assays to have a reactive result after infection.

Table 1. Laboratory stages of primary HIV infection based on the emergence of viral markers in 51 seroconverting plasma donors.

Stage	Marker					Duration in days (95% CI) ^a	
	RNA	P24 Antigen	NS Antibody (EIA)	S	Western blot	Individual	Cumulative
I	+	–	–	–	–	5.0 (3.1, 8.1)	5.0 (3.1, 8.1)
II	+	+	–	–	–	5.3 (3.7, 7.7)	10.3 (7.1, 13.5)
III	+	+	–	+	–	3.2 (2.1, 4.8)	13.5 (10.0, 17.0)
IV	+	+/-	–	+	I	5.6 (3.8, 8.1)	19.1 (15.3, 22.9)
V	+	+/-	+/-	+	+ ^b	69.5 (39.7, 121.7)	88.6 (47.4, 129.8)
VI	+	+/-	+	+	+	Open-ended	Open-ended

^aCalculations are based on a parametric Markov model.

^bWithout p31 band.

CI, Confidence interval; I, indeterminate; NS, not sensitive, refers to second-generation not IgM-sensitive enzyme immunoassay (EIA); S, sensitive, refers to IgM-sensitive third-generation EIA.

- Today, 3/5 of the assays used for these estimates are no longer in wide use.

Why is Fiebig staging outdated?

- Fiebig stages can only be assigned to people who have discordant test results.
 - Useful for distinguishing people with acute or early infection (partial seroconversion) vs. someone who's fully seroconverted, but not for infection dating with any precision (especially after seroconversion).

But people still use it all the time...?

- It is common to employ Fiebig staging loosely, i.e., to assign stages to a particular individual based on the classes of tests rather than the particular tests used in diagnosis.

But people still use it all the time...?

- It is common to employ Fiebig staging loosely, i.e., to assign stages to a particular individual based on the classes of tests rather than the particular tests used in diagnosis.

<i>Diagnostic delay:</i>	16.7 days	4.85 days		March 14, 2022

More importantly

- The Fiebig staging system only provides meaningful information in cases where a person presents with discordant test results on a single day, indicating incomplete seroconversion.
 - i.e., during Fiebig stages I-IV.
- Most individuals present to clinics or research studies after already reaching Fiebig stage V.
 - Then you know nothing, except that they've fully seroconverted already.
 - This is true even if there is a recent negative result.

2

What is an “EDDI”?

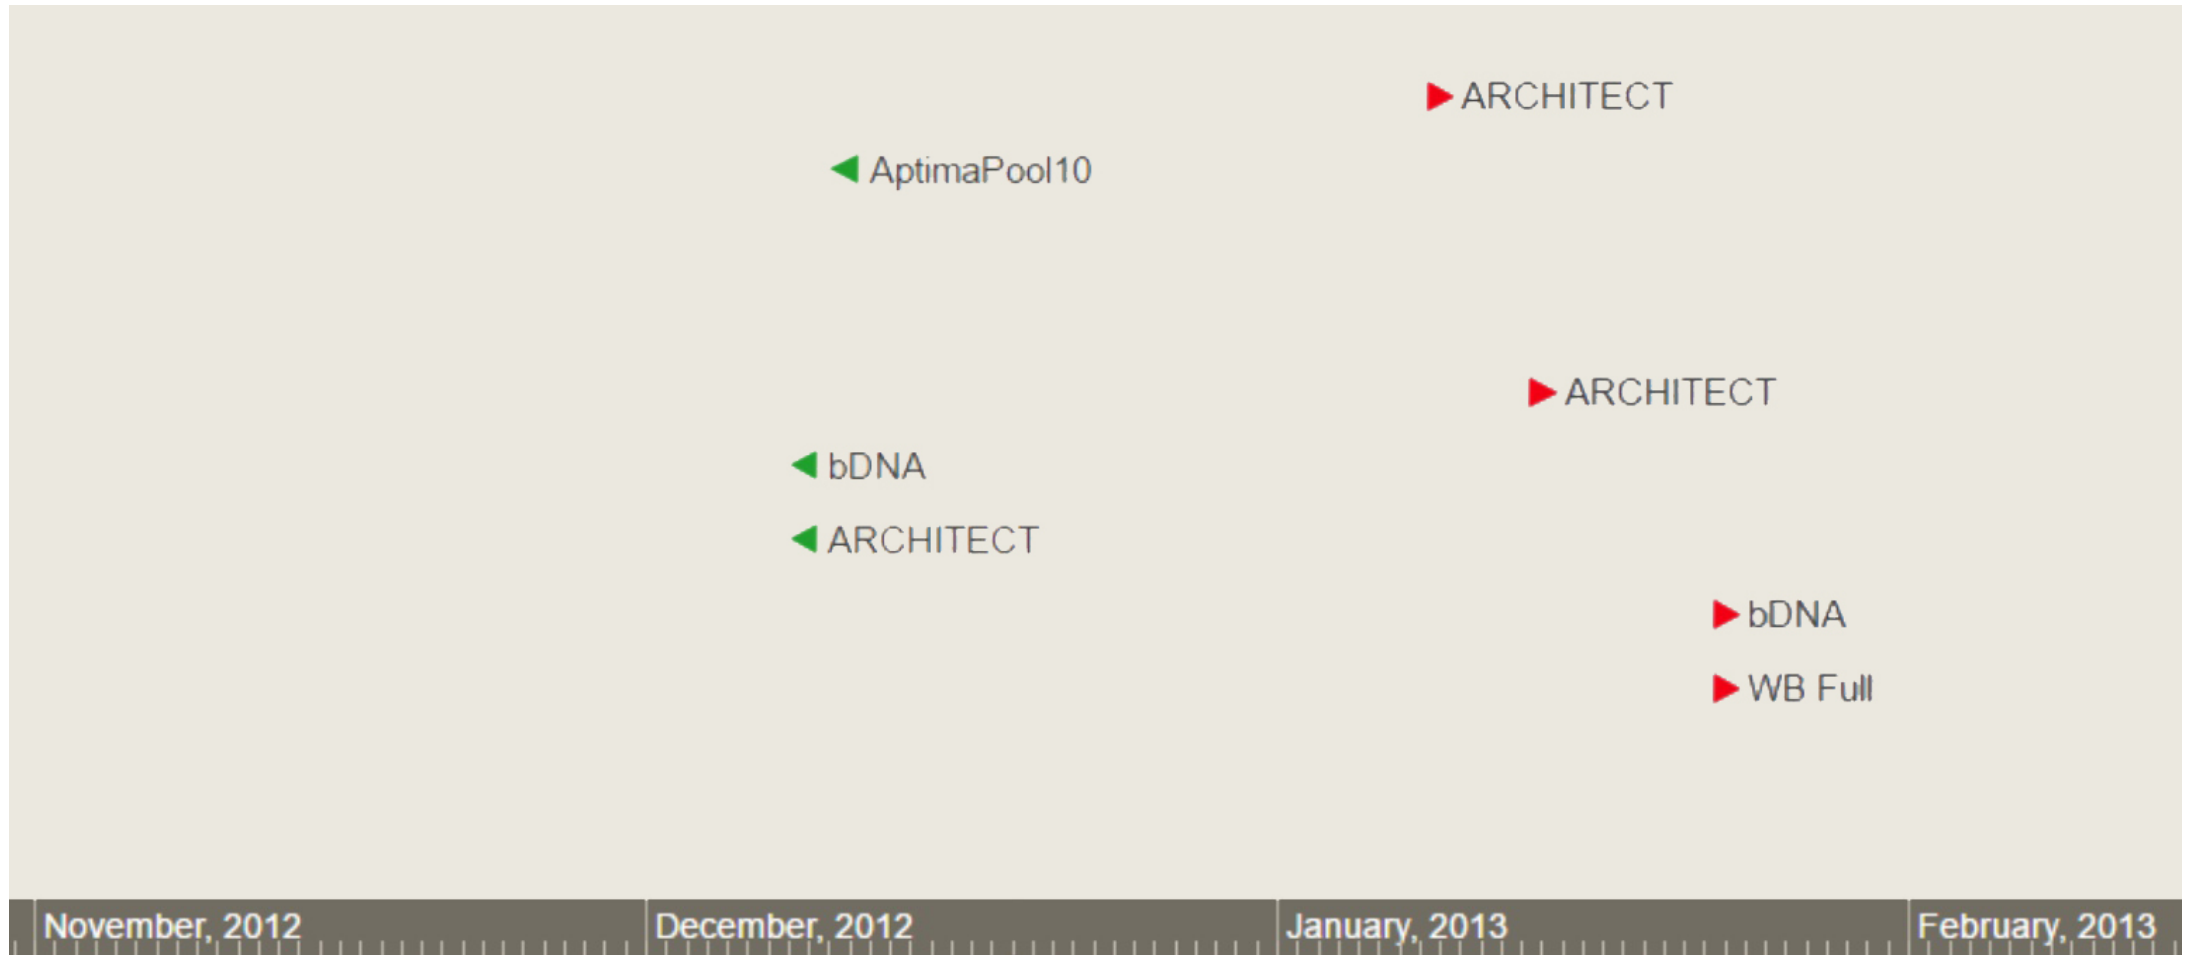

What is an “EDDI”?

- EDDI stands for “Estimated Date of Detectable Infection”
- This method uses an individual’s testing history to generate a plausible interval of calendar days during which earliest detection by a specified reference test (by default, a viral load assay with a detection threshold of 1 copy/mL) would have occurred.
 - Any reference test could be chosen, it doesn’t have to be that default.
- This interval is bounded by the Earliest Plausible Date of Detectable Infection (EP-DDI) and Latest Plausible Date of Detectable Infection (LP-DDI). The midpoint of this “DDI interval” serves as the point estimate, or EDDI.
- Only requirement (other than testing history) is information on the relative “diagnostic delays” of assays in their history.
 - Masciotra *et al.* J Clin Virol Dec 2011; Delaney *et al.* CID Jan 2017; Pilcher *et al.* AIDS 2019
 - Diagnostic delays need to be calibrated to whatever reference test is chosen.

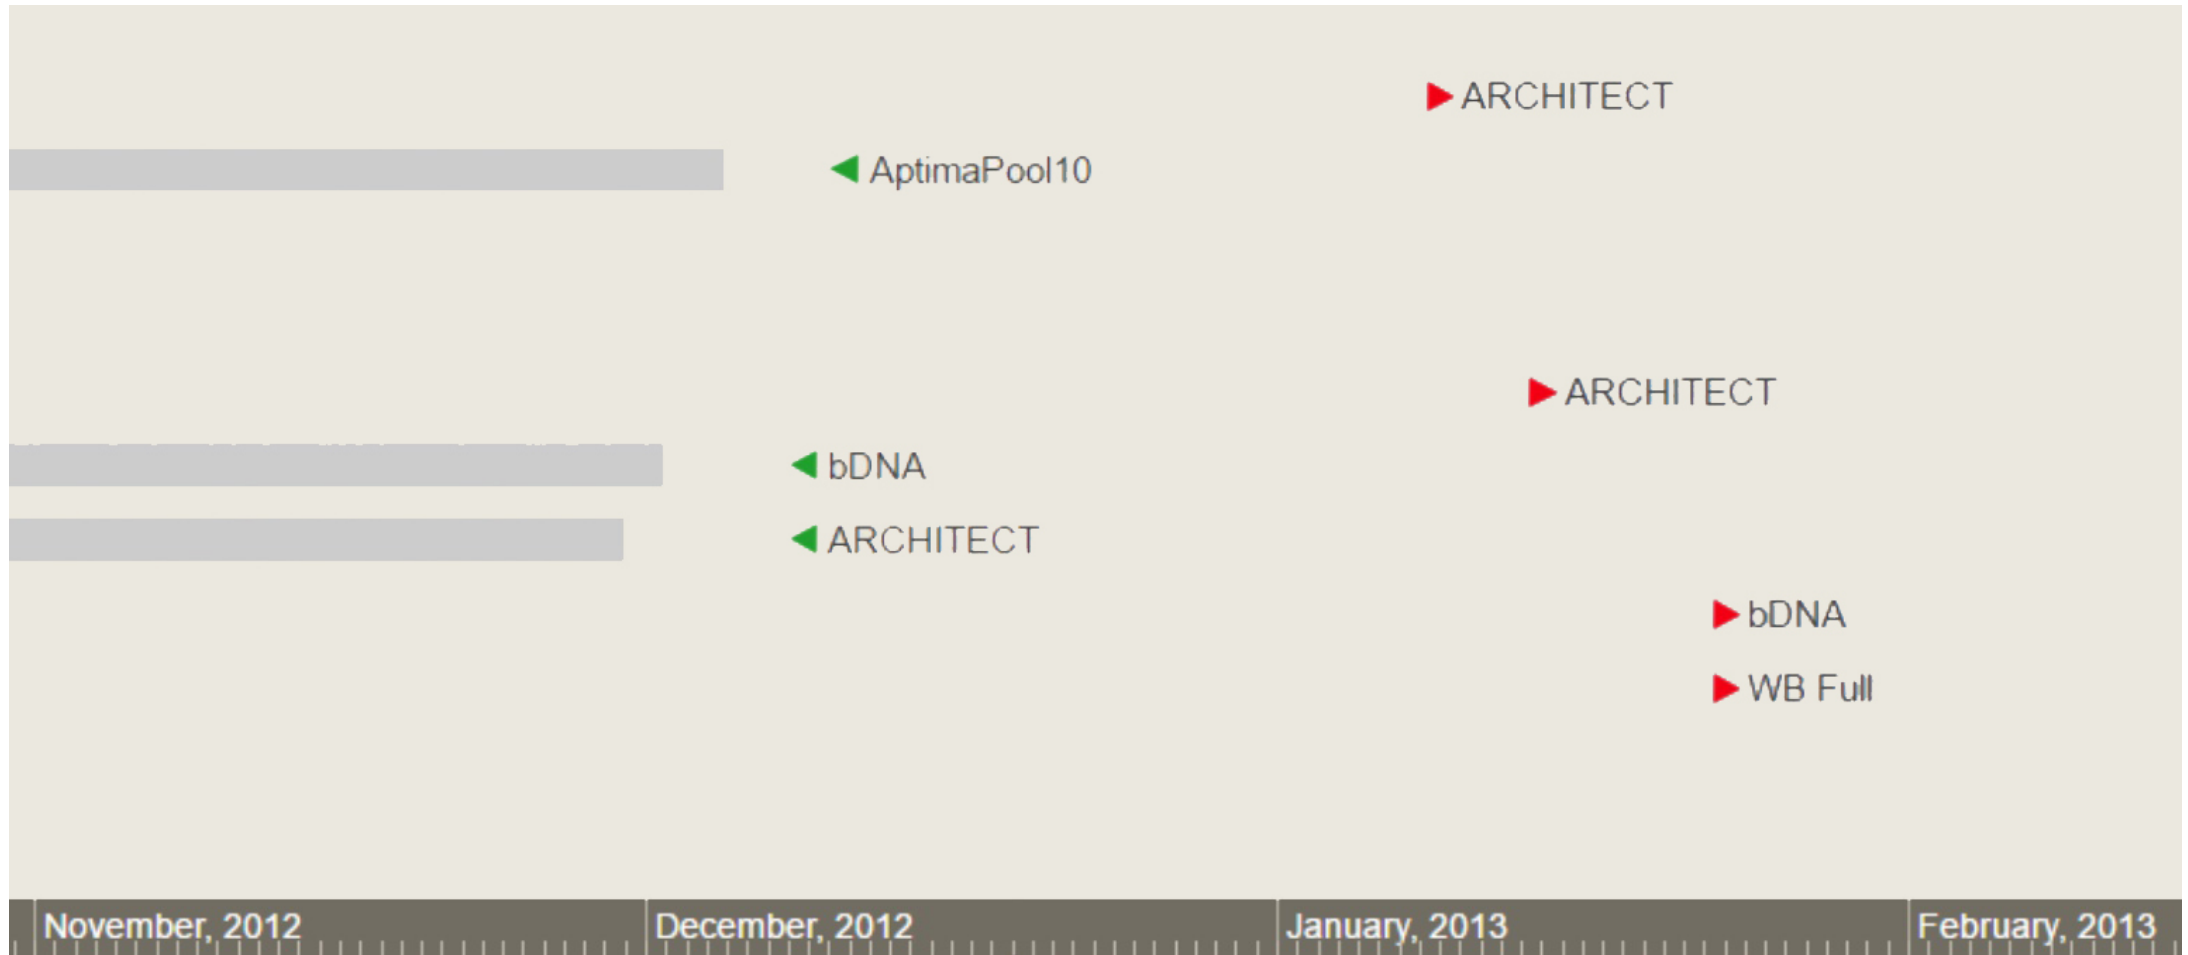

Diagnostic Testing History

Test Date	Adjusted Date	Test Name	Test Estimate	Test Result
Dec. 10, 2012	Nov. 30, 2012	ARCHITECT	CDC calc adjusted	Negative
Dec. 10, 2012	Dec. 2, 2012	bDNA	DT formula	Negative
Dec. 12, 2012	Dec. 5, 2012	AptimaPool10	DT formula	Negative
Jan. 10, 2013	Dec. 31, 2012	ARCHITECT	CDC calc adjusted	Positive
Jan. 15, 2013	Jan. 5, 2013	ARCHITECT	CDC calc adjusted	Positive
Jan. 24, 2013	Jan. 16, 2013	bDNA	DT formula	Positive
Jan. 24, 2013	Dec. 27, 2012	WB Full	CDC calc adjusted	Positive
Jan. 24, 2013	Jan. 14, 2013	ARCHITECT	CDC calc adjusted	Positive
March 26, 2013	March 18, 2013	bDNA	DT formula	Positive
April 23, 2013	April 15, 2013	bDNA	DT formula	Positive

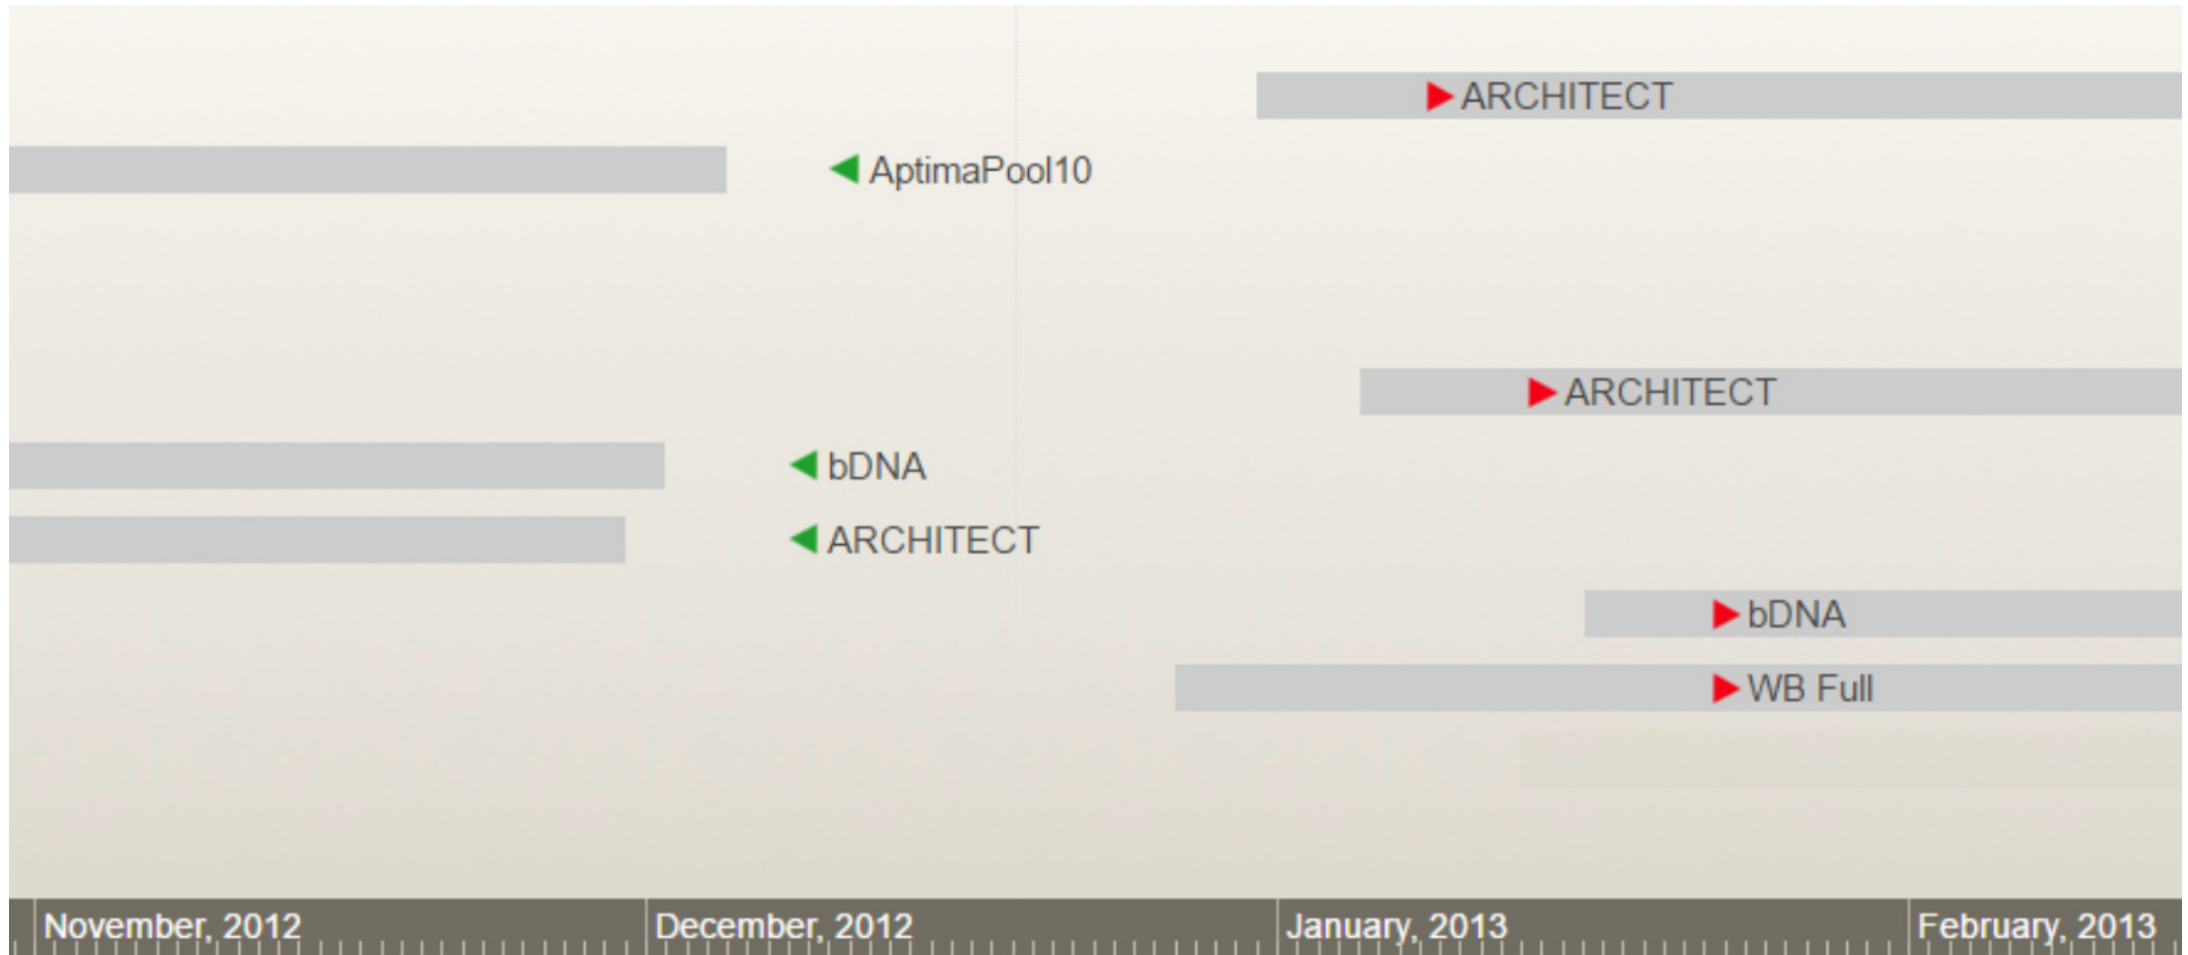

How to calculate an EDDI, and DDI interval (visual illustration)

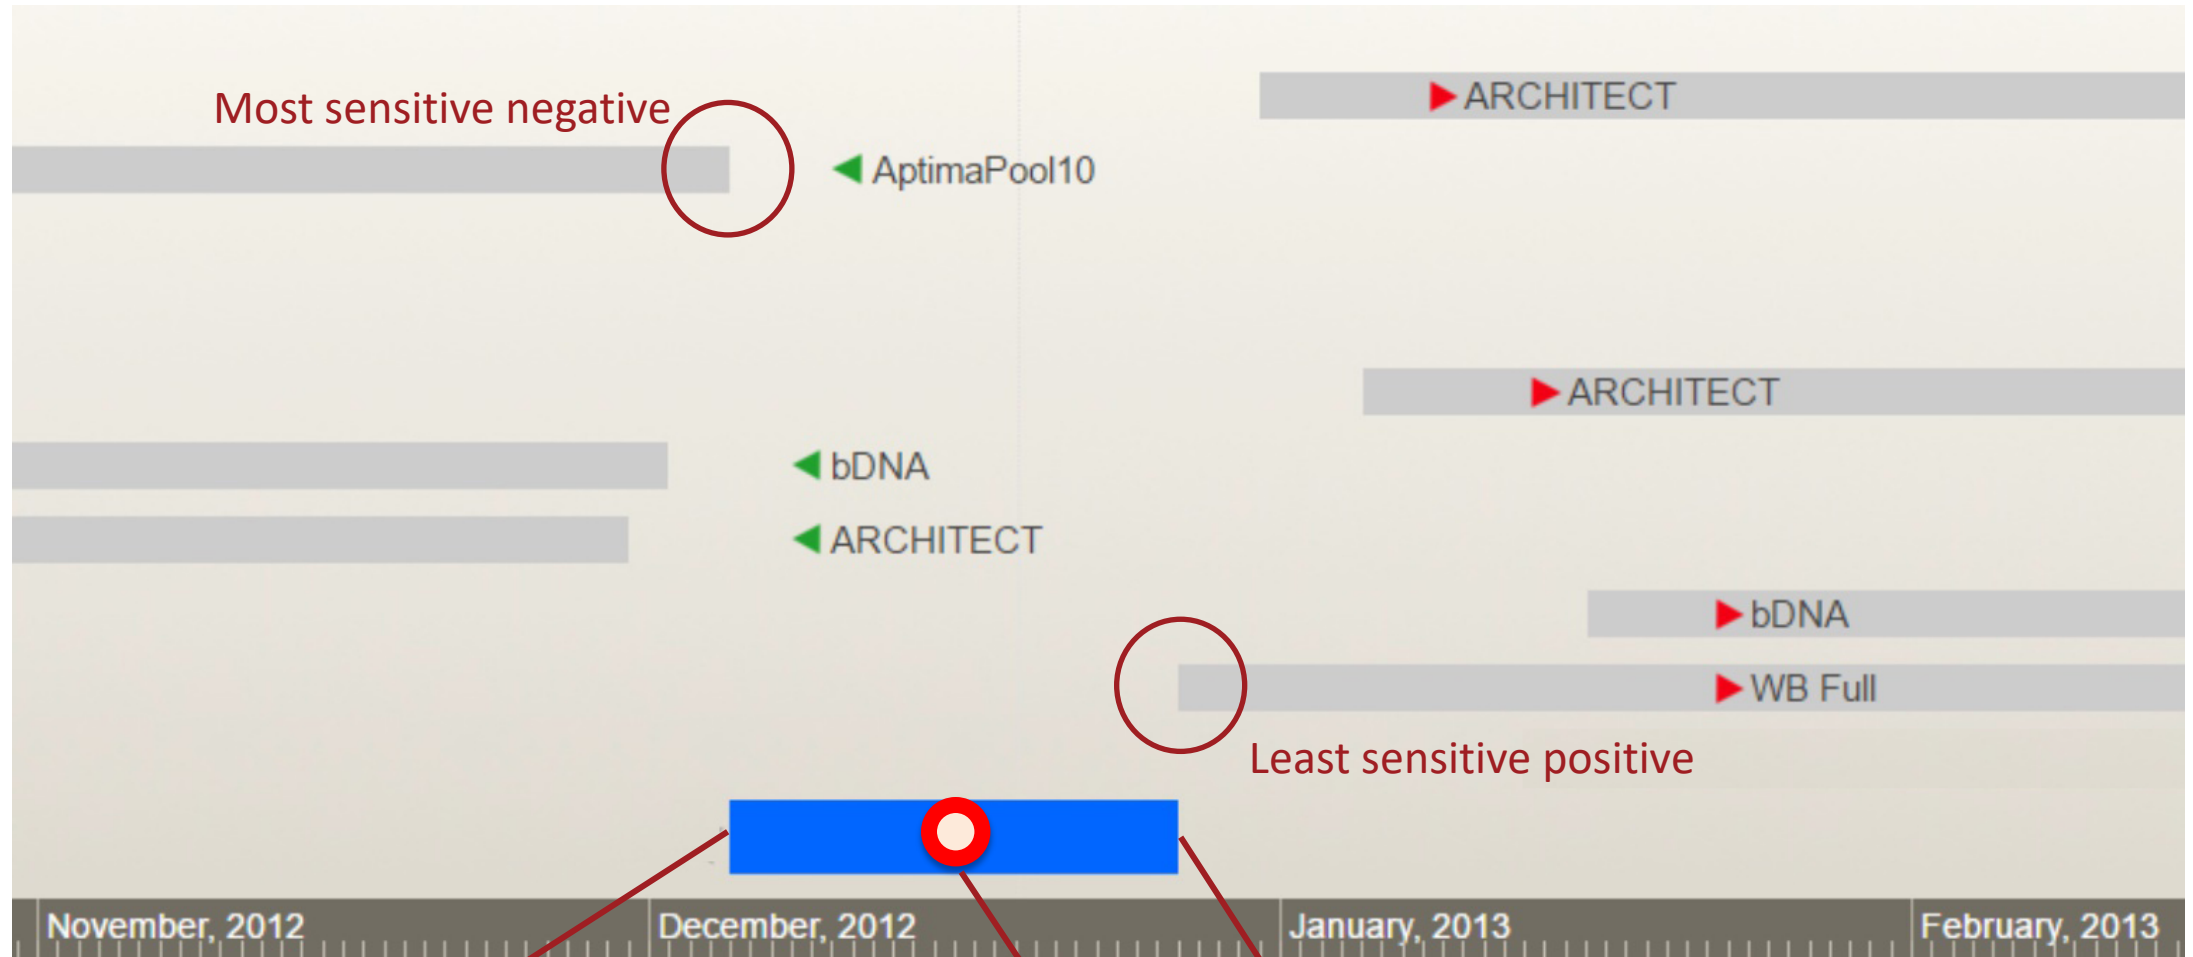

How to calculate an EDDI, and DDI interval (visual illustration)

How to calculate an EDDI, and DDI interval (visual illustration)

How to calculate an EDDI, and DDI interval (visual illustration)

EP-DDI = December 5, 2012

LP-DDI = December 27, 2012

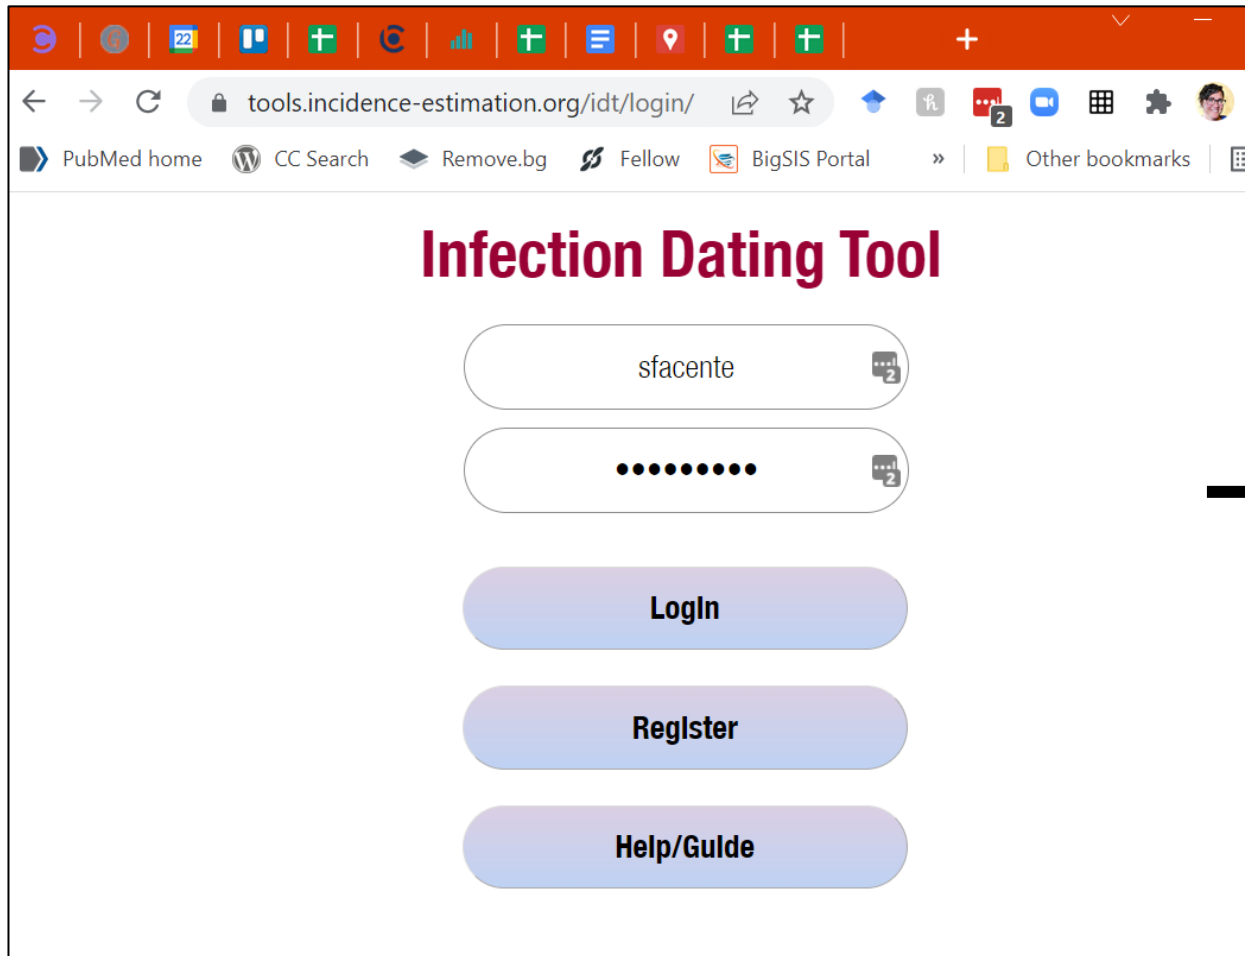

DDI interval = 22 days

EDDI = December 16, 2012

So how can I calculate EDDIs?

The Infection Dating Tool (IDT)

A screenshot of the Infection Dating Tool (IDT) login page. The browser's address bar shows the URL `tools.incidence-estimation.org/idt/login/`. The page features a header with various icons and a navigation bar with links to PubMed home, CC Search, Remove.bg, Fellow, BigSIS Portal, and Other bookmarks. The main content area is titled "Infection Dating Tool" in a large, bold, maroon font. Below the title, there are two input fields: the first contains the username "sfacente" and the second contains a masked password ".....". To the right of each input field is a small icon of a person with a speech bubble. Below the input fields are three blue buttons: "Login", "Register", and "Help/Guide".

A screenshot of the Infection Dating Tool (IDT) data upload page. The browser's address bar shows the URL `tools.incidence-estimation.org/idt/data_files/`. The page features a header with various icons and a navigation bar with links to PubMed home, CC Search, Remove.bg, Fellow, BigSIS Portal, and IDT. The main content area is titled "Infection Dating Tool" in a large, bold, maroon font. Below the title, there are five red buttons: "Testing Histories", "Mapping", "Tests", "Residual Risk", and "Help". Below these buttons, there is a section titled "Data file:" which is circled in red. This section contains a "Choose File" button, the text "No file chosen", and an "Upload" button.

The Infection Dating Tool (IDT)

- Upload a .csv or .xlsx file with 4 columns
 - Long format
 - Call tests whatever you want (you'll map them the first time)
 - Results are always positive or negative

Bottom line

Bottom line...

- Fiebig staging is familiar, and an easy way to categorize people by evolution of infection.
 - But, it's a 20-year-old system based on technology that is outdated.
- The EDDI system is adaptable, flexible, and useful beyond seroconversion to help estimate someone's infection timing.
 - And there's a free tool to help calculate EDDIs easily!
 - You can still categorize people's infection timing if you choose.
- Just like our technology, it's time to update the way we think about how we use that technology to better understand a patient or research participant's HIV story.
